

Figure 1 is a line plot showing the performance of different methods on the 15 instances absolute targets dataset. The x-axis represents the number of instances (2, 3, 5, 10, 20, 40) and the y-axis represents the performance metric. The plot shows that the performance of the methods (represented by colored lines and markers) generally increases with the number of instances, while the baseline (represented by a thick orange line) remains relatively stable. The methods are labeled with 'x' marks, indicating they are not the baseline. The baseline is labeled '1.2.1.2'.
